

# Accabonac Harbor

## Aerial Mosquito Larvicide: 2019

Targeted treated areas represented by the pink blocks replaced larger historic treatment locations represented by the blue crosshatched blocks. Some areas, such as the south end of Accabonac did not have significant mosquito larvae to warrant treatment in 2019. The area within the red crosshatch was restricted due to protected species nesting during part of the mosquito sampling season. Mosquito dipping locations plotted using GPS are shown on the map by dip points using a scale of breeding intensity from low (green) to extreme (red).
